Sydney Aged Care

Dear Dr Smith,

Outreach podiatry review

I reviewed Jane at the Sydney Aged Care outreach clinic today for routine foot care and footwear advice. Jane uses a frame and has recently asked for support when walking.

On inspection there was dry skin at both heels and a small amount of superficial callus beneath the first metatarsal heads. No open lesion, discharge or focal redness was seen. The nails required minor smoothing. The heel of Jane's current slippers was loose and did not hold the foot securely. No vascular pressure measurements or formal sensory testing were undertaken during this limited visit.

I gently filed the nail edges and applied moisturiser to intact heel skin. I did not perform invasive callus debridement, and no bleeding was observed. Her charted apixaban treatment was noted; I have not advised interruption or alteration of any medicine.

The impression is routine skin and nail-care needs with footwear that could provide a more secure fit. These findings do not explain Jane's dizziness, and I have not diagnosed a vascular, neuropathic or infective foot condition from this review.

Recommendations

1. Use footwear with a secure heel and fastening, checking comfort and skin after wear. Seek staff help with footwear and essential walking while Jane is unsteady.

2. Continue regular inspection of the feet and moisturise intact dry heel skin, avoiding application between the toes. Report a new skin break, redness, discharge or pain to the nursing team.

3. Arrange a routine podiatry review in approximately six weeks, or earlier for a new foot concern. This recommendation is not a confirmed booking.

Please let our outreach service know if footwear problems or foot discomfort are limiting Jane's participation despite these measures.

Yours sincerely,
Daniel Brooks
Podiatrist
